                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes a novel sugar beet plant, including its descendants expressing 5-enolpyruvylshikimate-3-phosphate synthase (cp4/epsps) enzyme activity which is obtainable by Agrobacterium mediated transformation with a gene allowing expression of cp4/epsps in plants, where the plant lacks both right and left T-DNA border sequences. The transgenic sugar beet plants of the invention are capable of tolerating herbicide treatment with glyphosate (also known as N-phosphonomethyl-glycine) as the active ingredient, e.g. Roundup.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                7214

A chemically inducible plant gene expression cassette which comprises an inducible promoter linked to a gene (I) that confers resistance to a herbicide, is claimed. (I) imparts resistance to N-phosphonomethylegivene (glyphosate) or its salts, but may also be a gene for resistance to, e.g. chhoroacetanilides, glufosinate, sulphonyl ureas, imidazolones, etc. The inducible promoter (e.g. alcA, alcA, alcA, aldA or other alcR-induced gene promoter) is operatively linked to an alcR regulator sequence. Induced expression of (I) avoids the risk that constitutive expression may interfere with plant development; allows volunteer plants to be controlled by herbicide applied without inducer and minimises the chance that herbicide-resistant strains of weeds will arise. The expression cassette is strictly controlled and suitable for general use in plants (both mono- and discyledons). The alcAlcR gene switch was exemplified with genes conferring resistance to glyphosate. The switch was used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              drive inducible expression of glyphosate oxidase (GOX) in plants. Switchable GOX was expressed alone or in conjunction with constitutive expression of 5-enol-pyruvylshikimate 3-phosphate (RPSPS) CP4. Constructs were optimised for expression in mono- and dicotyledonous crop species. The present sequence comprises a fusion of the GOX gene fused to the chloroplast transit sequence I from Arabidopsis RUBISCO (CPTI). This sequence was ligated into pWJBI (see TBS666) and used in construction of
                                                                                                                                                                    expression cassette: inducible promoter; alcA; alcA; regulator; alcohol dehydrogenase; herbicide resistance gene; glyphosate; herbicide resistance gene; glyphosate; herbicide resistance gene; glyphosate; GOX; EPSPS; 5-enol-pyruvylshikimate 3-phosphate CP4; chloroplast transit sequence 1; Arabidopsis; RUBISCO; CPT1; dicotyledon; monocotyledon; crop; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Chemically inducible cassette for expressing herbicide resistance gene in plants - and derived plants, partic. for resistance to glyphosate, avoids constitutive expression and minimises development of herbicide tolerant weeds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 1631 BP; 342 A; 454 C; 381 G; 454 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes a novel sugar beet plant, including its descendants expressing 5-enolpyruvjshikimate-3-phosphate synthase (cp4/epsps) enzyme activity which is obtainable by Agrobacterium mediated transformation with a gene allowing expression of cp4/epsps in plants, where the plant lacks both right and left T-DNA border sequences. The transgenic sugar beet plants of the invention are capable of tolerating herbicide treatment with glyphosate (also known as N-phosphonomethyl-glycine) as the active ingredient, e.g. Roundup.
                                                                                                                                                                                                                                                                                                                  plant;

                                                                                                                                                                                                                                                                                                                     This invention describes a novel sugar beet plant, including its descendants expressing 5-enolpyruvylshikimate-3-phosphate synthase (cp4/epsps) enzyme activity which is obtainable by Agrobacterium mediated transformation with a gene allowing expression of cp4/epsps in plants, where the plant lacks both right and left T-DNA border sequences. The transgenic sugar beet plants of the invention are capable of tolerating herbicide treatment with glyphosate (also known as N-phosphonomethyl-glycine) as the active ingredient, e.g. Roundup.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    7475

nucleotide sequence are claimed. The nucleotide sequences or ORFs can be used e.g. in the transportation of compounds to and from an organism which is a host to at least one of the nucleotide sequences, ORFs or proteins, the degradation and/or metabolism of organic, inorganic, natural or xenoblotic substances in a host organism or the modification of the host range, introgen fixation abilities; for obtaining a synthetic especially for nodulation efficiency on host plants.

metalloprotease thrombospondin (METH) proteins METH1 and METH2
metalloprotease thrombospondin (METH) proteins METH1 and METH2
respectively. METH1 and METH12 have been found to be potent inhibitors of
anglogenesis both in vitro and in vivo. They can be used for treating
cancer and other disorders related to anglogenesis including abnormal
wound healing, inflammation, rheumatold arthritis, psoriasis,
endometrial bleeding disorders, diabetto retinopathy, some forms of
macula degeneration, haemanglomas, and arterial venous malformations.
They may be useful in treating deficiencies or disorders of the immune
system, by activating or inhibiting the proliferation, differentiation,
or mobilisation (chemotaxis) of immune cells. The etiology of these
immune deficiencies or disorders may be genetic, somatic, such as
cancer or some autoimmune disorders, acquired (e.g. by chemotherapy or
toxins), or infectious. They can also be used to treat inflammatory
conditions, both chronic and acute conditions. The products can also be
used for detection and diagnosis. 232002 to 232080, and ¥49503 to ¥49511

                                                                                                                                                                                                                          sequence. P. aeruginosa is an opportunistic human pathogen present in soil water and plants. The specification describes virulence polypeptides and nucleic acid sequence encoding such polypeptides. These sequences can be used to identify a compound which is appable of decreasing the expression of a pathogenic virulence factor. Compounds that inhibit the expression or activity of virulence factor polypeptides can be used to treat pathogenic infections, especially where the infection is a P. aeruginosa infection.

Is a P. aeruginosa infection. The specification were poorly legible, and in some instances assumptions were made as to the identity of the base; it is therefore possible that the sequence given below is not entirely
                                                                                                                                                                                                               The present sequence represents a Pseudomonas aeruginosa nucleic aicd

                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                             The present sequence represents a Pseudomonas aeruginosa nucleic aicd sequence. P. aeruginosa is an opportunistic human pathogen present in soil water and plants. The specification describes virulence polypeptides and nucleic acid sequence encoding such polypeptides. These sequences can be used to identify a compound which is capable of decreasing the expression of a pathogenic virulence factor. Compounds that inhibit the expression or activity of virulence factor polypeptides can be used to treat pathogenic infections, especially where the infection is a P. aeruginosa infection.

Is a P. aeruginosa infection.

In some instances assumptions were made as to the identity of the base; it is therefore possible that the sequence given below is not entirely
                                                                                                                                                                                                                                                                                                                                                                                                                                  76 CGCCGCGGATTCAAAGTCACCTTGATTGACCCGAACCCTCCTGGCGAAGGTGCATCGTTT 135

The present sequence represents a novel hybrid gene construct from an example of the present invention. The present invention describes a novel method for providing a novel DNA sequence encoding a polypeptide from a microorganism with an activity of interest. The method comprises: (i) PCR amplification of the DNA with PCR primers with homology to (a) known gene(s) encoding a polypeptide with an activity of interest; (ii) linking the obtained PCR product of a 5' structural gene sequence and a 3' structural gene sequence; (iii) expressing the resulting hybrid DNA sequence; (iv) screening for hybrid DNA sequences nociding a polypeptide with the activity of interest or a related activity; and (v) isolating the hybrid DNA sequence identified in step (iv). This method provides for identification and isolation of sequences from microorganisms without having to cultivate and isolate the

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                     1 ATGCCTGAGAACCACAAAAA.........AAACGGGTCCGGCAAGTTAA 1296
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 6,

Determination of this BAC-end sequence was carried out as part of a collaboration with the European Drosophila Genome Project (EDGP) - http://www.edgp.ebi.ac.uk - This Drosophila melanogaster BAC library (Dros BAC) was made by Alain Billaud at CEPH (Centre d'Etude du Polymorphisme Humain) with funding provided by a MRC and Genevieve Payan. It has been constructed in the vector
  Genoscope.

HindIII: Rice is one of two most popular grains in the
world. Half of the world population especially those
inhabiting highly populated areas of the humid tropics
and subtropics, rely on rice as their primary source of
carbohydrate. Monocotyledonous rice is a diploid plant
(2n-24) with a haploid genome equivalent of 431 Mbp
(Arumuganathan and Earle, 1991). The relatively small
genome of rice, three times larger than that of
Arabidopsis, makes it suitable for genomic studies. In
order to facilitate positional cloning, physical mapping
and genome sequencing of rice, we have constructed a BAC
library from Oryza sativa, Nipponbare variety. The
library from Oryza sativa, Nipponbare variety. The
library contains 36, 864 clones with an average insert size
of 128.5 Kb providing 10.9 haploid genome equivalents. The
deep coverage allows the isolation a particular sequence
with a probability of 99.9 %. Two high density filters,
each containing 18,432 clones (doubly spotted), represent
the whole library for colony screening."

Submitted (12-APR-2000) to the EMBL/GenBank/DDBJ databases
This sequence is a single read and was generated as part of a large
scale clone-end sequencing project of the Tetraodon nigroviridis
genome. For more information, please take a look at

XhOI; M. truncatula sterilised seeds were germinated for
72h at 25 C, before transplanting into a 1/3 Epoisses soil:
2/3 calcined Terragreen mix in the presence of onion
root fragments colonized by the arbuscular mycorrhizal
fungus Glomus intraradices (Schenck & Smith, isolate LPAB). The plants were watered every day and twice a week with
a modified nutrient Long Ashton solution without phosphate
but with a high level of nitrate. After 3 weeks RNA was
extracted from whole root systems. CDNA was prepared from
polyA+ enriched RNA. The colon Stratagene and packaged using
Gigapack Gold packaging extractes. Plasmids containing CDNA
inserts were mass-excised from phage stocks using ExAssit
helper phage and propagated in Solk cells. Clone ordering
and sequencing was performed by the Centre National de
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Eukaryota; Metazoa; Nematoda; Chromadorea; Diplogasterida;
